PERFORMANCE TESTING PHASE

Dashboard Evidence • Functional Checks • Testing Limitations

College	MEDI-CAPS University	**Project type**	Individual Project

Global Fuel Prices and Taxation Analysis (2020–2026)

Purpose: To learn the concepts of Tableau and data analytics.

1. Dashboard & Dataset Checks

The supplied project evidence supports documentation of dataset scale, dashboard structure, visible controls and basic website functionality. It does not constitute a formal load test or measured performance benchmark.

Parameter	Evidence / observation	Limitation
Dataset scale	CSV contains approximately 27,468 records across 84 countries and 7 regions, covering January 2020–April 2026.	Source dataset size only; not a rendering-speed benchmark.
Data preparation	CSV connected directly to Tableau Public to build charts and dashboards.	No separate ETL tool, SQL cleaning pipeline or detailed transformation log documented.
Filters & legends	Scenario 3 shows Income Level, Region and Subsidy Level filters. Scenario 1 shows a Region legend; Scenario 2 shows Region and Measure Names legends.	Legends are not filters unless configured that way. Filter response time was not measured.
Calculation fields	Visualisations use Tableau aggregations such as averages and country rankings.	No custom calculated fields could be confirmed from the available evidence.
Dashboard design	3 dashboards; 4 visualisations per dashboard; 12 total. Desktop layout uses a two-by-two chart grid.	Mobile responsiveness and timed rendering were not tested.
Tableau Story	A separate Story is not confirmed as implemented in the supplied evidence.	If required by the course, create and verify it before marking complete.

Source note: These observations follow the uploaded performance-testing document, pages 1–2. No unsupported response-time or database-performance claims have been added.

2. Performance Check Summary

Check	Status	Evidence / limitation
Workbook/dashboard availability	Observed	Published Tableau Public workbook link was provided; screenshots of all three dashboards are available.
Dashboard visual structure	Observed	Each dashboard screenshot shows four visualisations arranged in a grid.
Filter controls	Observed in Scenario 3	Income Level, Region and Subsidy Level controls are visible in the supplied screenshot.
Dataset scale	Metadata available	Approximately 27,468 records, 84 countries and 7 regions; not a rendering benchmark.
Load time / latency	Not measured	No stopwatch result, browser performance trace or benchmark supplied.
Concurrent-user capacity	Not tested	No load or concurrency test was performed.
Mobile responsiveness	Not tested	Available screenshots show a desktop view only.
Tableau Story performance	Not confirmed	A separate Story has not been established as implemented.

Interpretation

The evidence confirms the workbook's visible dashboard structure and available controls. It does not quantify rendering speed, query latency, concurrency or mobile behaviour; those require separate measurements.

3. Website Functional Testing

The uploaded source document reports four basic website checks as passed. These are functional checks, not performance benchmarks.

Test case	Procedure	Reported result
Website availability	Opened the live website hosted on Render and checked that it loaded without errors.	Pass
Page content	Verified the website title and project overview were displayed correctly.	Pass
Tableau dashboard integration	Checked that the embedded Tableau Public dashboard loaded on the website.	Pass
Dashboard interaction	Tested interaction with the embedded dashboard, including navigation or available filters.	Pass

Website test summary: 4 of 4 basic functional checks were reported as passed in the supplied source. This result does not establish page-load speed, response latency, concurrent-user capacity or mobile responsiveness.

4. Conclusion & Project Links

The project contains three scenario dashboards with four visualisations each and visible filtering controls in Scenario 3. The supplied evidence supports recording dashboard structure and basic website interaction. Numerical performance claims should not be made without separate timed or benchmark testing.

Recommended follow-up checks

- Measure page-load and dashboard-rendering time using a consistent method.
- Test the site on common mobile viewport sizes.
- If needed, run a controlled concurrency/load test with an appropriate tool.
- Confirm whether a separate Tableau Story is a mandatory deliverable and verify its implementation.
- Record the test date, browser, device, steps, and results for reproducibility.
